

The last fabric you'll ever need to replace!

The innovative MicroLux™ (Microfiber) fabric saves resources while providing patients with soft, comfortable linen. Made of 100% poly for strength, it washes with less energy, dries in a fraction of the time, and performs longer than poly/cotton blends.

In service longer

- No cotton to break in
- Tape washes right out
- Less prone to staining
- Competitors return linens
so as not to mix with their own (inferior) product

Softer, suppler feel

- Brushed on both sides
to provide caressing feel against patients' skin
- Improves patient experience
resulting in better care marks from patients
- Feels like 1000 thread count

Stays whiter longer

- No cotton/polyester mix
- Remains pristinely white
- Cleaner, premium look
with brighter white perceived as cleaner and finer

More profitable

- Improved linen quality
premium enough for a luxury cruise line
- Longer service without wearout
- No lost product in competitor shuffle
- Priced similar to T180's cost
- Much shorter conditioning time

Production savvy

- Equal production time to cotton/poly
- Lower iron temperature required
- Static bar needs to be effective
- Available pad and roller adjustments
